Abstract: -

In higher education governance, decision-makers face difficulties retrieving information from large volumes of unstructured data, including operational rules, gazette notifications, and scholarship schemes. Manual processes are time-consuming, error-prone, and expertise-dependent, leading to administrative bottlenecks. This project proposes an AI-Based Policy Retrieval System for the Ministry of Education (MoE) using a Retrieval-Augmented Generation (RAG) architecture that combines vector-based semantic search with Large Language Models (LLMs) for accurate, context-aware responses. The system implements a "Hybrid Inference" strategy with a secure Local Mode using open-source models (e.g., Llama 3 via Ollama) on offline hardware to ensure data sovereignty and privacy compliance, and a Cloud Mode via the Gemini API for public demonstrations. It supports intent-based querying beyond keyword matching and a grounded citation mechanism linking responses to the exact page and clause of source PDFs. The solution reduces retrieval time from hours to seconds while ensuring transparency, minimal hallucinations, and zero data leakage.

Keywords: Retrieval-Augmented Generation (RAG), Natural Language Processing (NLP), Vector Databases, Data Sovereignty, Smart Governance, Large Language Models (LLMs).
